CORE EXPERTISE

- Systems Architecture & Design
- Operational Workflow Analysis
- Process-First Automation Strategy
- AI-Assisted Decision Systems
- Solution / Systems Architecture
- Error Handling & Reliability Engineering
- Audit Logging & Governance
- Concurrency & Duplicate Prevention

TECHNICAL TOOLKIT

- n8n & Workflow Automation
- LLM Integration (OpenAI, Claude, Gemini)
- Prompt Engineering
- JavaScript & Python
- REST APIs & Webhooks

EDUCATION

PhD, Microelectronics
Universiti Teknologi PETRONAS, Malaysia

MPhil, Microelectronics
University of the Punjab, Pakistan

CERTIFICATION

AI For Everyone — DeepLearning.AI

CAREER TIMELINE

2024 – Present
Founder & Systems Architect
Meridux

2023 – Present
Independent Technical Consultant

2014 – 2018
Postdoctoral Researcher
Universiti Teknologi PETRONAS

2009 – 2014

Dr. Aamir Farooq
Systems Architect | Founder, Meridux

PROFESSIONAL SUMMARY

Systems Architect with 15+ years of engineering experience, including doctoral and postdoctoral research, applied to designing reliable operational systems for healthcare and service businesses. I approach business operations the way I approached engineering research problems: understand the system before touching it, identify structural constraints, and design for reliability rather than speed alone. AI and workflow automation are tools I apply once a workflow is properly understood — not a starting point. Founder of Meridux, where I design and build end-to-end operational systems with structured error handling, concurrency control, audit logging, and GDPR-aware data handling.

PROFESSIONAL EXPERIENCE

Founder & Systems Architect

Meridux | January 2024 – Present

- Design operational systems by analysing workflows, identifying structural constraints, and modelling how information should move through an organisation before introducing automation.
- Architect production-grade workflow platforms using n8n, REST APIs, JavaScript, Python, and AI technologies (OpenAI, Claude, Gemini) as implementation tools within a broader system design.
- Engineer structured error handling, retry mechanisms, operational monitoring, audit logging, and governance controls so systems remain reliable and auditable in production.
- Designed and built Meridux PatientCore, an operational workflow system for healthcare patient intake with intelligent routing, duplicate/concurrency prevention, and automated reporting.

Independent Technical Consultant

Self-employed | April 2023 – Present

- Delivered workflow analysis, systems design, and technical documentation for academic and commercial clients, translating operational problems into structured, implementable solutions.

SELECTED PROJECTS

Meridux PatientCore — Healthcare Workflow System

n8n · JavaScript · REST APIs · Google Workspace · Gmail API · OpenAI

- Redesigned patient appointment intake as a structured operational workflow — intelligent routing, duplicate prevention, and automated communications — before introducing any automation layer.

Prospect Intelligence Engine (PIE) — Operational Intelligence Platform

In development · n8n · Google Places API · JavaScript · REST APIs

- Designing a modular platform for systematic business discovery and prospect evaluation, combining structured data workflows with decision-support logic.

RESEARCH ACHIEVEMENTS

- Published multiple peer-reviewed research papers in microelectronics and sensing technologies.
- Inventor on a patented sensing technology developed during postgraduate research.
- Four years of postdoctoral research in industrial sensing systems (wireless sensing, PETRONAS collaboration).
